

From Structural Mapping to Intention Reasoning:

A Review of LLM-based Mobile Test Migration

- Conclusion

The Challenge of Heterogeneity

- ✓ Ecosystem Fragmentation: Diverse screen sizes, OS versions.
- ✓ Brittleness: Minor UI changes (e.g., renamed IDs) break traditional scripts.
- ✓ Maintenance Burden: High manual effort for test repair.

CraftDroid

AppFlow

Mapping-based using semantic similarity of widgets	Core Approach	Search-based exploring predefined behavior graphs
Static UI attributes (XML, resource IDs, widget hierarchies)	Primary Dependencies	Supervised learning of abstract screens and labeled data
Effective only when UI structures are highly similar	Robustness	Robust to layout changes and dynamic resource IDs
Often fails on icon-based or textless UIs	UI Support	Learns abstract widgets via supervised learning
No understanding of sequential test logic; widgets are treated in isolation	Intent Reasoning	No explicit understanding of test intent
Poor scalability in complex applications like shopping	Main Limitations	Lack of test oracles and poor domain generalization without retraining

Why we need Large Language Models?

Paradigm shift

From rigid structural mapping → semantic intention reasoning

- Introduction

- Conclusion

The Abstraction–Planning–Grounding Pipeline

Figure1 Pipeline

- Introduction
- Background
- **Methodology**
- Challenges
- Future & Industry
- Conclusion

The Abstraction–Planning–Grounding Pipeline

- Convert low-level UI actions into platform-independent representations (Figure 2)
- Typically expressed as natural language intentions.
e.g., “Verify successful login”
- Reduces dependency on UI structure and resource identifiers

Figure2 ITEM

- Introduction
- Background
- **Methodology**
- Challenges
- Future & Industry
- Conclusion

The Abstraction–Planning–Grounding Pipeline

✓ **Key benefit:**

Enables cross-app generalization

✓ **Key risk:**

- Natural language IR introduces ambiguity
- Abstraction quality sets the upper bound of migration success

- Introduction
- Background
- **Methodology**
- Challenges
- Future & Industry
- Conclusion

The Abstraction–Planning–Grounding Pipeline

- Translate abstract intentions into executable strategies on the target app
- Must resolve the 1-to-N mapping problem: One intent may require multiple UI actions (Figure 3)

Figure3 ReuseDroid

- Introduction
- Background
- **Methodology**
- Challenges
- Future & Industry
- Conclusion

The Abstraction–Planning–Grounding Pipeline

- ✓ Two dominant strategies
 - Planner-based approaches
 - Synthesis-based approaches

Planner-based Approaches

Synthesis-based Approaches

High: Preserves original semantics	Fidelity	Medium: May deviate from intent
Limited: Struggles with divergent workflows	Adaptability	High: Generates new execution paths
Effective only when UI structures are highly similar	Robustness	Robust to layout changes and dynamic resource IDs
Local execution failure	Risk	Semantic drift
Dead-end exploration	Typical Failure	Intent deviation

- Introduction
- Background
- **Methodology**
- Challenges
- Future & Industry
- Conclusion

The Abstraction–Planning–Grounding Pipeline

- Map abstract actions to concrete UI elements
- Vision-Language Models (VLMs) used when metadata is unreliable (Figure 4)
- Essential for modern icon-heavy and non-standard UIs

Enabling Technologies and Trade-offs

- ✓ Prompt Engineering & Context Limits
- ✓ Multimodal Context
- ✓ Self-Correction Loops

- Introduction
- Background
- **Methodology**
- Challenges
- Future & Industry
- Conclusion

Enabling Technologies and Trade-offs

- ✓ **Prompt Engineering & Context Limits**
 - Chain-of-Thought and in-context learning improve reasoning
 - Token limits force trade-offs between context depth and complexity
- ✓ Multimodal Context
- ✓ Self-Correction Loops

- Introduction
- Background
- **Methodology**
- Challenges
- Future & Industry
- Conclusion

Enabling Technologies and Trade-offs

- ✓ Prompt Engineering & Context Limits
- ✓ **Multimodal Context** (Figure 5)
 - Screenshots improve robustness
 - High computational cost
 - Loss of fine-grained details due to resolution constraints
- ✓ Self-Correction Loops

Detections:	normalized coordinates
0 Text Shortcuts	[0.001, 0.000, 0.283, 0.110]

16 Tab Automation	[0.327, 0.909, 0.680, 0.969]
17 Tab Gallery	[0.680, 0.909, 0.985, 0.969]

Shared Prompt

You are an AI visual assistance that can analyze mobile screens. You will receive information describing a screen, where each UI widget detection is represented using label, text, and bounding box coordinates separated by tab. Detections are separated with a newline. Bounding box coordinates are represented as (x1, y1, x2, y2) with floating numbers ranging from 0 to 1. These values correspond to the top left x, top left y, bottom right x, and bottom right y.

Task Prompt

Using the provided texts and coordinates, design question and answer pairs simulating the interactions between a user and system. Conversations should focus on potential user actions on the screen (vs perception). When creating conversations that refer to a specific widget, append bounding box coordinates directly after mentioning the widget, not at the end of the sentence. Only generate questions and answers that can be answered with given information, do not use background information.

One-shot example (For conversation tasks)

User: TextField search [0.019, 0.050, 0.909, 0.117]
Icon book [0.909, 0.067, 0.982, 0.109]
SegmentedControl FITNESS [0.017, 0.117, 0.278, 0.166] -

Assistant: User: How do I search for a new product?

System: You can use the TextField [0.019, 0.050, 0.909, 0.117] to search.

Advanced tasks overview

- Bounding box coordinates in detections are normalized
- Concatenate **shared prompt** and **task-specific prompt**
- For conversation tasks, add **one-shot example**
- Provide detections, prompt, and example to GPT-4
- Post-process raw output and convert to Ferret-UI format

Advanced tasks

Requires a deeper level of comprehension than elementary tasks, as user intent must be understood before providing relevant visual, location, or interactive information.

User: I would like to create a new shortcut.
System: You can click on the "Select +" Text [0.718, 0.070, 0.966, 0.108] to create a new shortcut.

User: How do I search for a specific shortcut?
System: You can use the "Search" TextField [0.024, 0.168, 0.548, 0.308] at the top of the screen.

User: I want to read some books.
System: Sure, you can go to Books by pressing the "book, Read Current, Play Current" button [0.000, 0.693, 1.000, 0.827] to get more about books.

Open Challenges in LLM-Based Test Migration

- ✓ Semantic Drift in Intention Abstraction
- ✓ Fragility of Visual Grounding
- ✓ Efficiency, Stability, and Feedback Loops

- Introduction
- Background
- Methodology
- **Challenges**
- Future & Industry
- Conclusion

Evaluation and Reproducibility Crisis

- Most studies evaluate on small and domain-limited app sets
- LLM randomness harms reproducibility
- Existing benchmarks focus on task completion, not semantic fidelity
- Mismatch: Reaching a final UI state $\neq$ preserving test intent (Figure 6)

Reaching a final UI state $\neq$ preserving test intent

Evaluation and Reproducibility Crisis

Need:

- Step-level, intent-aware evaluation metrics

- Introduction
- Background
- Methodology
- Challenges

- **Future & Industry**

- Conclusion

Future Directions

- ✓ Long-horizon agents
- ✓ On-device deployment

- Introduction
- Background
- Methodology
- Challenges
- **Future & Industry**
- Conclusion

Industrial Outlook: Amazon as a Case Study

- ✓ Vision-based testing scales better across heterogeneous devices
- ✓ Semantic test oracles replace hard-coded assertions
- ✓ Agent-based migration reduces maintenance costs
- ✓ Enables faster release cycles in large-scale systems

- Introduction
- Background
- Methodology
- Challenges
- Future & Industry
- **Conclusion**

Q & A

1. If VLMs can already “see” UI elements, why do we still need intention abstraction?

Because seeing UI elements $\neq$ understanding test intent.

VLMs ground actions to pixels, but intention abstraction decouples tests from UI structure, making migration robust to layout changes and enabling cross-app generalization.

- 2. Does LLM stochasticity undermine the reliability of automated testing?
- 3. Why is success rate an insufficient metric for evaluating test migration?

1. If VLMs can already “see” UI elements, why do we still need intention abstraction?
2. Does LLM randomness undermine the reliability of automated testing?
Yes, it does, but not necessarily usefulness.
Stochasticity introduces variance, which requires intent-aware evaluation and controlled execution, rather than eliminating LLMs altogether.
3. Why is success rate an insufficient metric for evaluating test migration?

1. If VLMs can already “see” UI elements, why do we still need intention abstraction?
2. Does LLM stochasticity undermine the reliability of automated testing?
3. Why is success rate an insufficient metric for evaluating test migration?
Because reaching the same UI state does not guarantee preserving test intent.
Success rate ignores semantic fidelity; migration must be evaluated at the step- and intent-level, not just final states.
